C;Comment: This is one of the short forms (S1a and S1b) of the human prolactin receptor eta-casein gene promoter activation, with S1a less effective than S1b. However, their lited COS-1 and HEX293 cells is due to rapid intracellular turnover of the receptor. #expe

-TISSUE SPECIFICITY: Isoform 2 is expressed in peripheral blood
-TISSUE SPECIFICITY: Isoform 2 is expressed in peripheral blood
-TISSUE SPECIFICITY: Isoform 2 is expressed in peripheral blood
-TISSUE SPECIFICITY: Isoform 2 is expressed in peripheral blood
-TISSUE SPECIFICITY: Isoform 2 is expressed in peripheral in urine and serum.
-TISSUE SPECIFICITY: Isoform together a cytokine-binding domain.
-TISSUE SPECIFICITY: The WSWS motif appears to be necessary for proper protein
-DOMAIN: The WSWS motif appears to be necessary for proper and cell-
-BOMAIN: The WSWS motif appears to be necessary for protein
-Folding and thereby efficient intracellular transport and cell-
-SUMIACCE receptor binding.
-TISSUE SPECIFICITY: Selongs to the type I cytokine family of receptors.
-SIMILARITY: Belongs to the type I cytokine family of receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          eptor alpha-chain.";

with low affinity, but does not transduce a signal. Signal
activation necessitate an association with IL6ST. Activation may
activation necessitate an association with IL6ST. Activation may
lead to the regulation of the immune response, acute-phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     reactions and hematopoiesis.

FUNCTION: Low concentration of a soluble form of interleukin-6 receptor acts as an agonist of IL6 activity.

SUBUNIT: Hexamer of two molecules each of IL6, IL6R and IL6ST.

SUBCELLULAR LOCATION: Type I membrane protein (isoform 1).

Secreted (isoform 2).

Secreted PRODUCTS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Name=1; Synonyms=Long;

SUBCELIULAR LOCATION: Type I membrane protein.
SUBCELIULAR LOCATION: Type I III-like domains contained in the DOMAIN: The two fibronectin type III-like domains contained in the C-terminal part form together a cytokine-binding domain.
C-terminal part form together a cytokine-binding domain.
C-terminal part form together a cytokine-binding for proper protein DOMAIN: The WSXWS motif appears to be necessary for proper protein folding and thereby efficient intracellular transport and cell-surface receptor binding.
SIMILARITY: Belongs to the type I cytokine family of receptors.

DOMAIN: The two fibronectin type III-like domains contained in the C-terminal part form together a cytokine-binding domain.

DOMAIN: The WSXWS motif appears to be necessary for proper protein folding and thereby efficient intracellular transport and cell-surface receptor binding.

SIMILARITY: Belongs to the type I cytokine family of receptors. SUMILARITY: Contains 1 fibronectin type III domain.

SIMILARITY: Contains 1 immunoglobulin-like C2-type domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 mitted (JUL-1990) to the EMBL/GenBank/DDBJ databases.
FUNCTION: Part of the receptor for interleukin 6. Binds to IL-6
with low affinity, but does not transduce a signal. Signal
activation necessitate an association with IL6ST. Activation may
lead to the regulation of the immune response, acute-phase
reactions and hematopoiesis.

                                                                                                                                                                                                                                                                                                                                               FUNCTION: IL-6 is a cytokine with a wide variety of biological functions; it plays an essential role in the final differentiation of B-cells into Ig-secreting cells, it induces myeloma and plasmacytoma growth, it induces nerve cells differentiation, in hepatocytes it induces acute phase reactants (By similarity). SUBCELLULAR LOCATION: Secreted.

SUBCELLULAR LOCATION: Secreted.
SIMILARITY: Belongs to the IL-6 superfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          142

SUBCELLULAR LOCATION: Secreted.

SUBCELLULAR LOCATION: Secreted.

SIMILARITY: Belongs to the IL-6 superfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  354 LPVEF-MPVPPGEDSKDVAAPHRQPLTSSERIDKQIRYILDGISALRKETCNKSIMCESS

Immunol. 155:3946-3954 (1995).

-i- FUNCTION: IL-6 is a cytokine with a wide variety of biologics functions: it plays an essential role in the final differenti of B-cells into Ig-secreting cells, it induces myeloma and plasmacytoma growth, it induces nerve cells differentiation, hepatocytes it induces acute phase reactants.

-i- SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDLINE=96003435; PubMed=7561102;

Submitted (JAN-1998) to the EMBL/GenBank/DDBJ databases.

Submitted (JAN-1998) to the EMBL/GenBank/DDBJ databases.

1- FUNCTION: It-6 is a cytokine with a wide variety of biological functions: it plays an essential role in the final differentiation of B-cells into Ig-secreting cells, it induces myeloma and of B-cells into Ig-secreting cells, it induces myeloma and plasmacytoma growth, it induces nerve cells differentiation, in hepatocytes it induces acute phase reactants (By similarity).

hepatocytes it induces acute phase reactants (By similarity).

FUNCTION: IL-6 is a cytokine with a wide variety of biologics functions: it plays an essential role in the final differention of B-cells into Ig-secreting cells, it induces myeloma and plasmacytoma growth, it induces nerve cells differentiation, hepatocytes it induces acute phase reactants.

Submitted (APR-2003) to the EMBL/GenBank/DDBJ databases.

In FUNCTION: II-6 is a cytokine with a wide variety of biological
-!- FUNCTION: it plays an essential role in the final differentiation
of B-cells into Ig-secreting cells, it induces myeloma and
plasmacytoma growth, it induces nerve cells differentiation, in
plasmacytoma growth, it induces nerve cells differentiation, in
plasmacytoma growth, it induces nerve cells differentiation, in
plasmacytoma growth, it induces nerve cells differentiation.
                                                                                                                                                                           Lama glama (Llama).

Interleukin-6 precursor (IL-6).
"Cloning and expression of interleukin 6 gene from Landrance x Meishan hybrid swine.";
Submitted (SEP-2000) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: II-6 is a cytokine with a wide variety of biological functions: it plays an essential role in the final differentiation of B-cells into Ig-secreting cells, it induces myeloma and plasmacytoma growth, it induces nerve cells differentiation, in hepatocytes it induces acute phase reactants.
-!- SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                           Mathialagan N., Bixby J.A., Roberts M.R.                               PUNCTION: IL-6 is a cytokine with a wide variety of biological FUNCTION: IL-6 is a cytokine with a wide variety of biological functions: it plays an essential role in the final differentiation of B-cells into Ig-secreting cells, it induces myeloma and plasmacytoma growth, it induces nerve cells differentiation, in hepatocytes it induces acute phase reactants.

SUBCELLULAR LOCATION: Secreted.

SIMILARITY: Belongs to the IL-6 superfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     468
